To find the contiguous subsequence with the greatest sum, a bottom up Dynamic Programming algorithm works:

```
def maxArray(c[], size)
      total = c[0]
      current = c[0]
      for 1 to size:
              current = max(c[i], current + c[i])
              total = max(total, current)
      return total
```
